About Us: BenChris & Associates, Inc. is a certified 100% minority-owned and woman-owned company with over 30 years of experience in sales, distribution, and service to federal, state, and local government agencies.

Medapro™-CF

AMNION REGENERATIVE THERAPY

A Cellular Framework for Tissue Repair

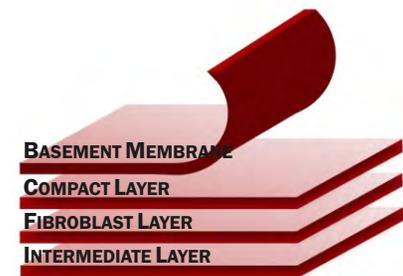

Medapro-CF

Medapro-CF is an allograft material that is carefully derived from human amnion using a proprietary and gentle process to produce a complex tissue scaffolding that is rich in extracellular matrix compounds.

By preserving the therapeutic and regenerative proteins, cells, and growth factors found in the extracellular matrix, **Medapro-CF** provides amnion regenerative therapy to support the body's natural healing process.

Why Focus On Amnion Regenerative Therapy?

The various tissue layers that make-up amnion each contribute to the utility of this material.

Amnion begins as part of the tissue structures which surround and protect the fetus during in utero development.

However, the same properties of the amnion membrane that benefit the fetus—e.g. abundant collagen and elastin for tensile strength and elasticity; antimicrobial peptides to resist microbial colonization; multiple growth factors that promote epithelialisation—make it an effective material in creating an environment conducive to the regeneration of healthy human tissues.

This is why amnion-derived products like **Medapro-CF** can be used extensively in wound care. As a therapeutic fixture, amnion is uniquely capable of being:

- Anti-inflammatory
- Anti-scarring
- Anti-bacterial
- Anti-adhesive
- Immunoprivileged

Complex Healing, Simple Solution

Whether due to age, lifestyle or nutrition, it is becoming more common that patients walking into healthcare facilities are medically compromised in some way that may impair an already complicated healing process. This can lead to chronic wounds, which in turn can represent a major financial burden on healthcare services.

The measured use of an amnion-derived allograft like **Medapro-CF**, however, may help to address some of the cost challenges of wound care treatment. In fact, clinical studies have demonstrated the value of using amniotic membrane derived products to care for complex wounds¹.

And while amniotic tissue is recognized for its abilities in the healing and regenerative repair of wounds, its properties also suggest a number of other benefits that are broadly relevant to surgical care, such as:

- Adhesion prevention^{2,3}
- Reduced scar tissue formation⁴
- Nerve bundle and peripheral wrapping⁵
- Angiogenesis support¹
- Pain management¹

The BenChris Mission

BenChris & Associates is wholly committed to providing best of class services to our federal, state, and local partners with a cost-conscious, patient-centric approach, and we are firmly committed to educating healthcare providers in the methods and the delivery of state-of-the-art biotechnologies which deliver high quality, clinical outcomes to a broad range of patients
